NEW EFFICIENCY STANDARDS AND DIRECTIVES APPLICABLE TO THREE-PHASE CAGE INDUCTION MOTORS

PREFACE

Numerous standards or regulations are currently used to define the efficiency of electric motors (NEMA, EPAct, NRCan, CEMEP, COPANT, AS/NZS, etc.), and others are in preparation.

It is becoming increasingly difficult for manufacturers to design motors for a global market and for users to understand the differences and similarities between standards in different countries.

Standard IEC 60034-30 defines the principle to be adopted and brings global harmonisation to energy efficiency classes for electric motors throughout the world.

Directive 2005/32/EC (6 July 2005) from the European Parliament has established a framework for setting the eco-design requirements to be applied to "energy-using products".

These products are grouped in lots. Motors come under lot 11 of the eco-design programme, as do pumps, fans and circulating pumps.

European directive EuP - lot 11 was voted on july 2009. It is based on standard IEC 60034-30 and define the efficiency classes whose use will be mandatory in the future.

It specifies the efficiency levels to be attained for machines sold in the European market and outlines the timetable for their implementation.

CONTENTS

■ New standard for measuring the efficiency of electric motors: IEC 60034-2-15
New standard for efficiency classification of electric motors: IEC 60034-30 (September 2008)
■ EuP (Energy using Product) European directive (summer 2009)
8
■ Main standards throughout the world and ranges concerned
■ FAQ10
Summary table of the scope of application for the standard and the directive
■ Table of Leroy-Somer series affected by the standard and the directive
■ Tables of rated efficiency values14
■ Conclusion16

■ New standard for measuring the efficiency of electric motors: IEC 60034-2-1 (September 2007)

EXISTING STANDARD

IEC 60034-2 of 1972, still in use, applicable up to November 2010

- Direct method¹ for all single-phase and three-phase motors
 - fixed rate for additional losses = 0.5% Pab

NEW STANDARD

IEC 60034-2-1 of September 2007 in widespread use since 2009

- SINGLE and THREE-PHASE ≤ 1 kW
 - preferred method² = direct method
- THREE-PHASE > 1 kW
 - preferred method² = method which adds the losses to the total measured additional losses

Comments:

- The new standard for efficiency measurement is not much used on the European market. It will start to be used more commonly during 2009. It is very similar to the IEEE 112-B method used in North America.
- Since the measurement standard is different, this means that for the same motor, the rated value will be different (usually lower) with IEC 60034-2-1. Example of a 22 kW 4P LSES motor:
 - in accordance with IEC 60034-2 = 92.6%
 - in accordance with IEC 60034-2-1 = 92.3%

¹ Method in which a machine's input kW is determined by measuring the torque on the shaft and the speed. The output kW is measured during the same test.

² As several methods are proposed, for reasons of simplicity, motors frame size 56-63-71 are measured with the direct method and larger frame sizes with the method where losses are added together.

■ New standard for efficiency classification of electric motors: IEC 60034-30 (September 2008)

Concerns: Induction motors, three-phase cage motors, single speed motors (this standard does not apply to motors with magnets).

- Un ≤ 1000 V
- Pn from 0.75 to 375 kW
- · 2, 4 and 6 poles
- S1 or S3 duty with OF ≥ 80%
- 50 and 60 Hz frequency
- Networked
- · All types of fixing, shaft extension, accessories
- All IP1x to 6x and IC0x to 4x

Not concerned:

- Motors specifically designed for variable speed in accordance with IEC 60034-25 (essentially reinforced insulation)
- •Motors which are fully integrated in a machine and cannot be tested separately (such as rotor/stator).

Three efficiency classes:

- IE1 = STANDARD efficiency level
- · IE2 = HIGH efficiency level
- IE3 = PREMIUM efficiency level

Characteristics	Description	Definition
IE1	Standard	comparable to eff2
IE2	High	comparable to eff1 and EPAct'92
IE3	Premium	comparable to EPAct'05
IE4	Super premium	At draft stage

This standard only defines efficiency classes and their conditions. It is then up to each country to define the efficiency classes and the exact scope of application.

Comments:

A fourth class is currently in preparation:

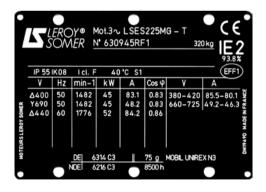

IE4 = SUPER PREMIUM efficiency

Technical specification IEC 60034-31 will set the efficiency levels for motors used in variable speed applications. The rated values will only apply to motors. The efficiency value will be set for a torque in a given speed range.

Once approved, it will integrate IEC 60034-30 which will be extended to permanent magnet synchronous motors (Dyneo).

The values indicated in the standard to define the efficiency class are minimum values. There is no tolerance on these.

The method for measuring the efficiency of a motor-drive (motor + drive) will be included in future standard IEC 60034-2-3.

■ EuP European Directive

Concerns: Motors defined under standard IEC 60034-30.

Obligation to release high-efficiency motors:

Class IE 2 from 16 June 2011

Class IE 3^{7} from 1 January 2015 for power ratings from 7.5 to 375 kW Class IE 3^{7} from 1 January 2017 for power ratings from 0.75 to 375 kW

The European Commission is currently working to define minimum efficiency values for drives.

In the second half of 2009, Leroy-Somer will start to affix nameplates to 1.1 to 90 kW motors in the 2 and 4-pole LS and LSES ranges in accordance with 60034-30. The FLS/FLES ranges will be the next in line.

Other power ratings in the LS and FLS ranges will be taken into account from the start of 2010, and 6 poles from 2011.

From January 2011, new high-efficiency motor ranges will gradually be introduced onto the market (IE2, then IE3).

The following are not concerned:

- Motors designed to operate when fully submerged in liquid
- Motors which are fully integrated in another product (rotor/stator)
- Motors designed to operate at
 - Altitude > 1000 m
 - Ambient air temperature > 40°C
 - Maximum operating temperature > 400°C
 - Ambient air temperature < -15°C or < 0°C for air-cooled motors
 - Cooling water temperature at product entry < 5°C or > 25°C
- Safety motors conforming to directive ATEX 94/9/EC
- Brake motors
- On-board motors (road, rail, water)

¹ or IE2 motor + drive

■ FAQ

Will there be any change to the motor nameplates?

The efficiency measurement standard does not require any change to the nameplate. However, application of the IEC 60034-30 standard involves some modifications. The two main ones are the efficiency value and the corresponding efficiency class (IE1, IE2, IE3) which must be indicated on the nameplate. The directive also requires the year of manufacture to be indicated on the nameplate (in plain text or as a code).

From September 2009, motors affected by the old CEMEP agreement (currently Eff1 and Eff2) will include the Eff level + the corresponding efficiency class on the nameplate.

Will there be a special "eff1" logo?

Neither the standard nor the directive will have a special logo. However, the efficiency classes will be clearly specified on the nameplates of the motors concerned.

From 16 June 2011, manufacturers will have to offer class IE2 motors in Europe. Will we be ready?

As of now, we are able to supply class IE2 IP55 motors from 0,75 to 375 kW, both 2 and 4-pole versions. These are LSES/FLSES motors developed for the "eff1" CEMEP agreement and for certain complementary markets such as "ECA" in England. 6P IP55 motors and also 2, 4 and 6P IP23 motors are already in preparation so as to be ready in accordance with the timetable.

■ FAQ

Are ATEX motors affected?

Yes, by the IEC. Not by the directive.

Are smoke extraction motors affected?

Yes, by the IEC, with some reservations. Yes, by the directive for smoke extraction temperature ≤ 400°C.

What services are associated?

We will put in place services which correspond to the new "standards", namely GA/RAC/SCO.

Can motors covered by IEC 60034-30 be used in variable speed applications?

Yes, but in this application, the rated efficiency is assumed not to apply because the voltage and current waveforms created by the drive are not sinusoidal. Supplying power via a drive therefore results in additional losses in the motor. According to specification 60034-17, these are estimated at 20% of the total losses. These losses have a direct impact on the "displayed" efficiency of the motor.

Motors with magnets are not affected by the existing standard and the directive.

■ Summary table of the scope of application for the IEC and the directive

Categories	Affected by IEC 60034-30	Affected by EuP
2, 4, 6 P std motors 0.75375 kW S1 IP1x, to 6x	yes	yes
Motors which are fully integrated and cannot be tested separately	no	no
ATEX, brake motors 2,4, 6 P 0.75375 kW S1 IP4x, 5x, 6x	yes (measurements taken without accessory)	no
Std motors + accessories (gearbox, FV, encoder, etc)	yes (measurements taken without accessory)	yes (measurements taken without accessory)
High-temperature motors for smoke extraction ≤ 400°C	yes	yes
Motors in short-time duty S2, or intermittent duty S3, S4, S	no	no
Other special motors for drives (PM, multi-speed, etc)	no	no
Motors for built-in cooling function	yes	no
Motors for gearboxes (MI or MU)	yes	yes

CONCLUSION

Leroy-Somer already has high-efficiency motor ranges, conforming to classes IE1 and IE2.

As far as class IE3 is concerned, developments are ongoing.

It is important to note that the greatest efficiency gains are obtained by analysing and optimising the whole system.

This systemic approach can achieve energy savings which are often in excess of 40%. In addition, Leroy-Somer already offers drives which are in an efficiency class that matches or exceeds the future IE4 (Dyneo range of motors with permanent magnets).
